## FAST FITTINGS TECHNICAL CATALOGUE

## INTRODUCTION

EO Fast Fittings are designed to join steel, polyethylene and other various pipes. It is a compression system developed to give End Load capability and ensures that the installation is not leaking.

This completely new system optimises and simplifies the following operations:

- **Assembly** of new installations.
- Corrective and preventive **maintenance** of the existing installations.
- **Modification** of an existing installation, by substitution of components or incorporation of new elements (valves, measuring and control tools, etc.) that were not originally planned.

EO Fast Fittings range, alternative or complementary to the threaded fittings, is grouped with the following programme:

### TYPES:

### APPLICATIONS:

#### 1 Fast Fittings

General applications:

- New assemblies.
- Maintenance.
- Modifications.

#### 2 Intake Clamps

Specially designed for new derivations and/or branches and for modifications of existing installations.

#### 3 Reparation Clamps

Developed as repair/maintenance clamps.

# 1

## TECHNICAL DESCRIPTION OF THE SYSTEM

### COMPONENTS AND MATERIALS

#### FAST FITTINGS WITH NUT

(Fig. 1)

**① and ② Bodies and compression nut:** White Heart malleable cast iron GJMW 400-05, according to EN 1562, hot dip galvanised.

**③ Rubber seal:**

NBR Elastomere Shore A80 according to DIN 3535-3, suitable for sanitary and potable use, combustible gases (natural, manufactured gas and LPG) and not combustible (air,...) and apolaric hydrocarbons (gas-oil)

**④ Washer:** normalised steel.

**⑤ Locking ring:** normalised steel with special grooves.

#### FLANGED FAST FITTINGS

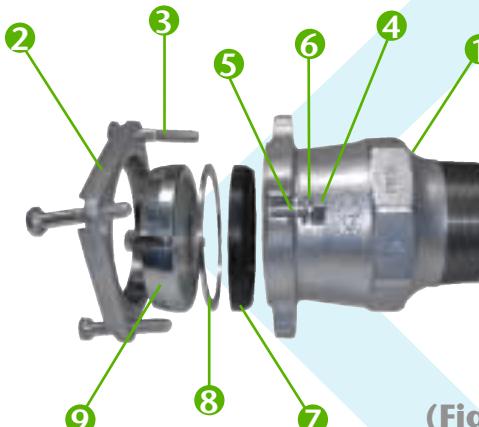

**① and ② Body and compression flange:** White Heart malleable cast iron GJMW 400-05, according to EN 1562, hot dip galvanised.

External metallic assembly components by tightening of the flange with the body:

**③ screw, ④ nuts, ⑤ flat washers, ⑥ Grower washers.**

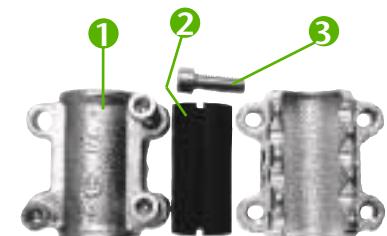

**Internal assembly components:**

- ⑦** NBR elastomeric rubber seal Shore A80 according to DIN 3535-3 standard,
- ⑧** metallic washers in normalised steel,
- ⑨** locking ring in normalised steel.

(Fig. 2)

#### INTAKE AND REPAIR CLAMPS

(Fig. 3)

**①** body made by White Heart malleable cast iron GJMW 400-05, according to EN 1562, galvanised.

**②** Rubber seals, suitable for sanitary and drinkable water and for other several fluids.

**③** Screws M10 in normalised steel, galvanised.

## DESIGN PARAMETERS

**Working conditions:** With steel pipes EN 10255, EN 10208-1 or equivalents DIN 2440, 2441, 2442, 2448, series 1, 2458 series 1, BS 1387, ISO 65 and plastic pipes HDPE and LDPE.

	Pressure	Temperature
Water	-0,8 to 25 bar	-20° to +80°C
Gas	up to 1 bar	-20° to +70°C

Having in mind that EO fast fittings system could be used with higher values to those indicated above, in these cases please consult the supplier.

With plastic pipes, maximum working pressure is the nominal maximum pressure of the pipe. When using plastic pipes for gas conduction, it is necessary to insert a metallic liner.

**Alignment:** +/- 3 °

**Axial mobility:** EO Fast Fittings system has no axial mobility up to 1 bar pressure. For pressures higher than 1 bar, steel pipe could suffer any axial displacement ( up to 3 mm ) up to readjustment of the locking ring.

**Torsion angle ( $\beta$ ):** EO Fast fittings have not been designed specifically to support torsion angles.

**Tensile strength:** EO Fast fittings are resistant to tensile strength resulting from the longitudinal strength of the working conditions.

**Sliding resistance:** EO Fast fittings are resistant to the external axial sliding strength.

## INSTRUCTIONS FOR A CORRECT ASSEMBLY

### FAST FITTINGS

Especially when we are in a new assembly, to reach a faster and safer leakiness, it is necessary to remove previously the piece.

- Cut the pipe to be connected perpendicularly to the axis and eliminate all outside and inside dirtiness in order to make the pipe end completely smooth.
- Clean externally and internally the end of the pipe, especially where the joint would be made, ensuring it is free of grease, dirt, loose particles etc.
- The position and order of the different elements is as follows:

FAST FITTINGS WITH NUT (See FIG. 1)

- 1° Compression nut ②
- 2° Locking ring ⑤ \*
- 3° Washer ④
- 4° Rubber seal ③
- 5° Body ①

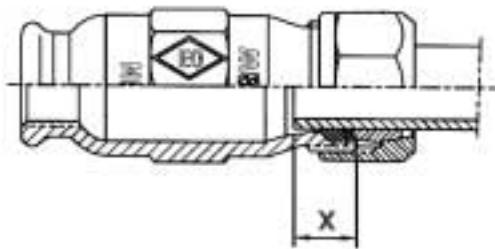

\* If assembly without angularity, put the nick of the locking ring against the nut.

If assembly with angularity, put the nick of the locking ring against the washer.

FAST FITTINGS WITH FLANGE (See FIG. 2)

- 1° Compression flange ②
- 2° Locking ring ⑨
- 3° Washer ⑧
- 4° Rubber seal ⑦
- 5° Body ①

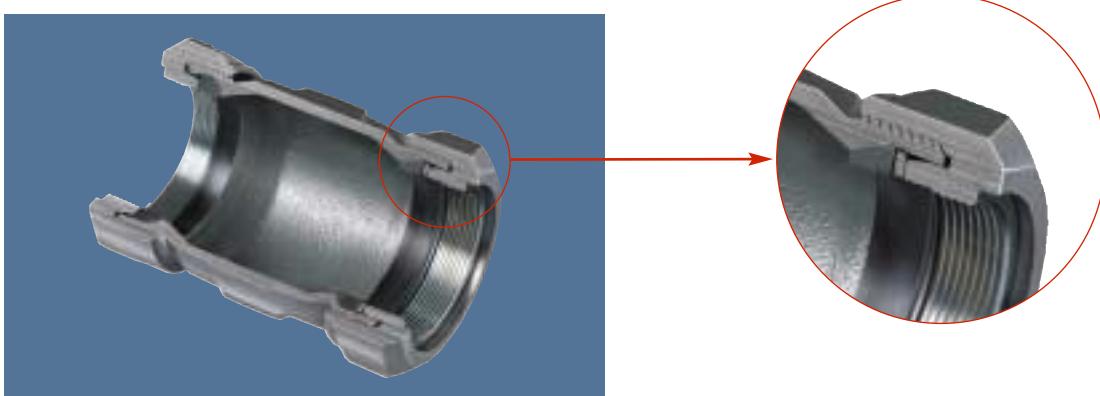

- To guarantee a correct joint it is very important that the locking ring of the Fast Fitting is located cone to cone, in the nut or flange, and assembled correctly on the pipe axis.

- The insertion length (x) of the pipe inside the Fast Fitting will be as indicated in the table of models and dimensions. The indicated values correspond to the final assembly.

- Once the body is blocked with the help of an auxiliary tool, pipe should be assembled as well as the nut or flange to proceed to its tightening or hand screwing.

To end the assembly, it is necessary to tighten up to the end by a suitable tool.

- Internal jointing components should be used only once. By substitution of those by other new jointing components, new assemblies could be done as first time.
- Each piece of the EO Fast Fittings system is a set individually adjusted, not being possible to exchange assembly elements with nuts, flanges or bodies produced by other manufacturers.

#### INTAKE AND REPARATION CLAMPS

- Be sure that in the part to be repaired or derivate, the pipe is not rough or has not significant deformations that will avoid the correct adjustment of the rubber seal.
- Clean dirtiness, grease, etc from the part to be repaired or derivate.
- In reparation clamps, the rubber seal should remain well located in the seat of the bodies with its opening in the opposite part of the leak.
- In intake clamps, the hole of the pipe should correctly match with the hole of the rubber seal avoiding to strangle the fluid.
- Fix the bodies with the rubber seal by hand, starting the operation with the part of the body in which the screws are going to be tightening.
- Finally, put the screws and screw on to the end.

## 2

## APPLICATION FIELD

TYPES	APPLICATION	TEMPERATURE	PRESSURE
Fast Fittings	Water (drinkable and sanitary, and other general uses as irrigation, washing, etc)	-20 to +80°	-0,8 to 25 bar
Intake Clamp	Combustibles	-20 to +80°	up to 1 bar
	Compressed air	ambient	up to 7 bar
Reparation Clamp	Oil and apolaric hydrocarbons	up to 70°	up to 15 bar

Having in mind that EO fast fittings system could be used with higher values to those indicated above, in these cases please consult the supplier.

## 3

## NORMALISATION, CERTIFICATION AND INSPECTION DOCUMENTS

## REFERENCE BASIC TECHNICAL STANDARDS

## Fast Fittings:

- product according to DIN 3387
- NBR Rubber seal shore A80 according to DIN 3535-3
- threads - pressure tight according to ISO 7/1 (PrEN 10226/1)
- threads - not pressure tight according to ISO-EN 228/1

## QUALITY CERTIFICATION

## Fast Fittings

## • Product DIN-DVGW

- Water: No. DW-8511BN06026
- Gas: No. NG-4502BN0540

## • Registered firm EN ISO 9001

## INSPECTION DOCUMENTS

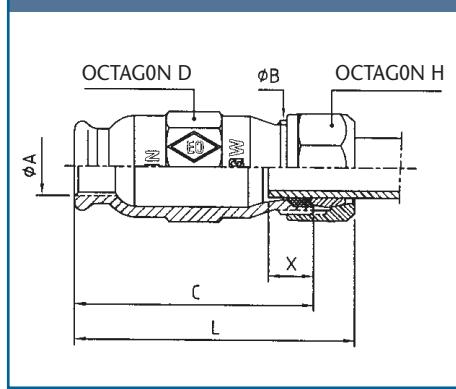

Under request of the customer or by previous agreement, ATUSA could settle a Certificate of conformity, types 2.1 or 2.2 according to the EN 10204 standard.

## COMMON PRACTICAL APPLICATIONS EXAMPLES

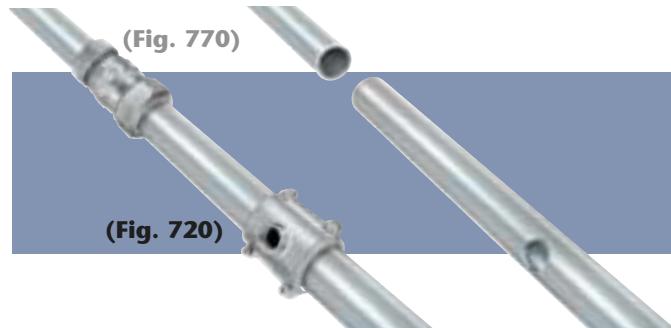

Joint through mechanic compression system, that defines to the EO fast fittings, has been largely experienced with very satisfactory results in very different applications, traditional (drinkable and sanitary water, irrigation), gas, compressed air, petrol stations,... as well as other recent applications (fire protection systems).

In all cases, it is mandatory to have in mind technical specifications related to its design, assembly and working conditions.

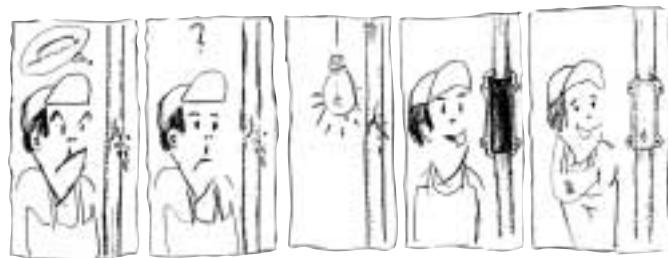

### ASSEMBLY OF A NEW INSTALLATION THROUGH

- Double joint (Fig. 770)
- Intake clamp (Fig. 720)

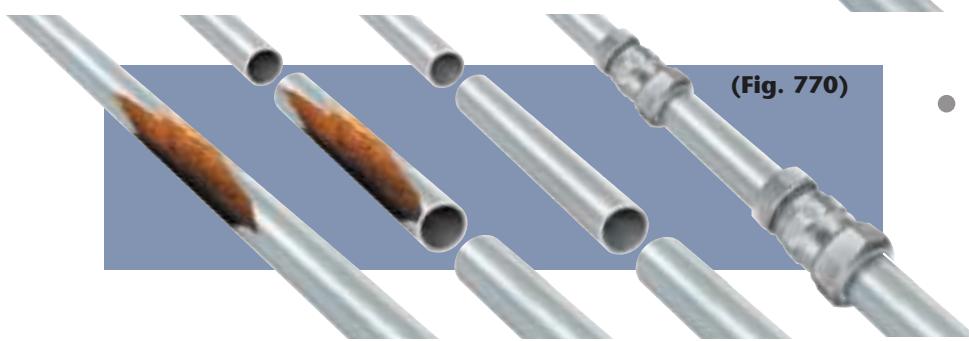

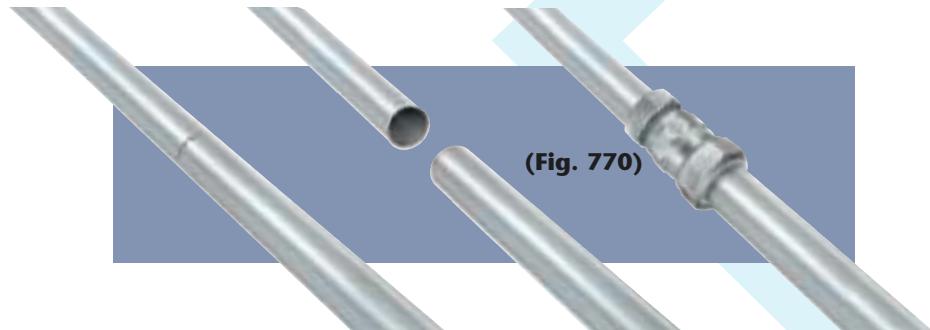

### REPAIR OF EXISTING INSTALLATIONS

- Pore or small longitudinal fissure and reparation trough Reparation Clamp.

- Significant fissure and reparation through Double Joint, Fig. 770, cutting previously affected part.

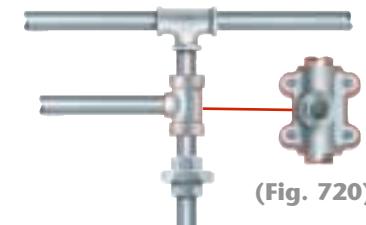

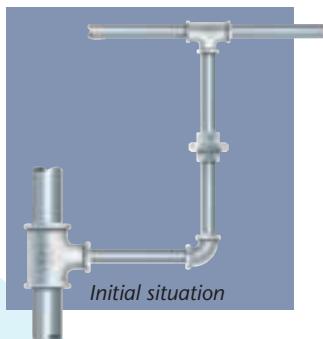

- Oxidation source and reparation through Double Joint, Fig. 770, cutting previously and by substitution of the affected part of the pipe.

- Deformation of a visible part of the pipe, caused by an external charge and reparation through Double Joint, with the same procedure as in the previous situation.

## CHANGE ON EXISTING INSTALLATIONS

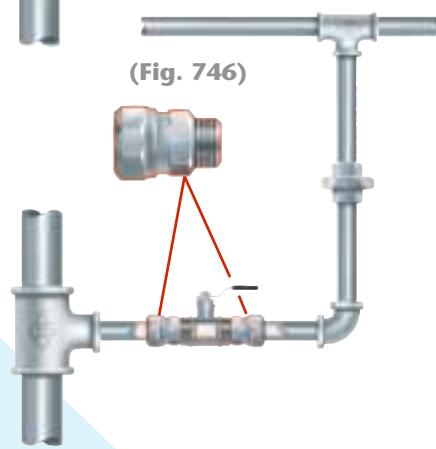

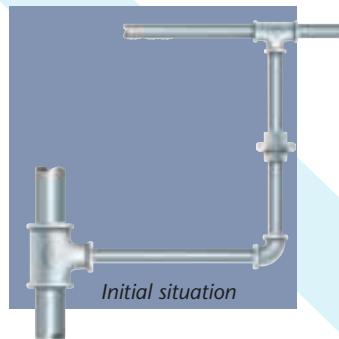

- To add a new branch by using an Intake Clamp (fig.720), on an existing installation

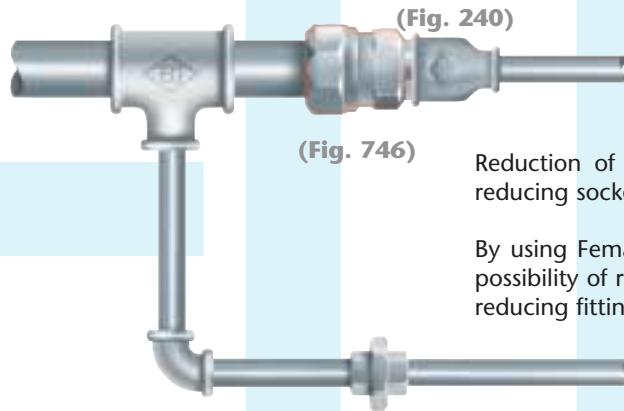

New Branch  
through intake  
clamp

- To include new elements to an installation: valve, filter, pressure regulator, ball valve, etc., that were not originally planned, by using Female joints (fig.740) or Male joints (fig. 746)

## PRACTICAL AND SIMPLE CONNECTIONS TO EXISTING INSTALLATIONS

Reduction of the pipe through a Male Fast Fittings (fig.746) and a reducing socket (fig. EO 240).

By using Female (fig. 740) or Male Fast Fittings (fig.746), giving easy possibility of reducing the pipes through the use of threaded malleable reducing fittings.

## QUICK CONNECTIONS IN IRRIGATION INSTALLATIONS

The wide range of Fast Fittings, Intake and Repair Clamps are designed to allow quick substitution of component parts, within the joint, thus providing versatility and allowing fast jointing to suit the required application.

CHRYSSAFIDIS

### WRONG APPLICATIONS

- In vertical installations, submitted permanently to tensile strength and/or high vibrations. Ex. Submersible pumps connection.
- When installed in the end of the conduction lines, as plugs or ball valves connection, if the permanent maintenance of the installation is not guaranteed.
